

## AMENDMENTS TO THE CLAIMS:

The listing of claims will replace all prior versions, and listings, of claims in the application:

### LISTING OF CLAIMS:

1. (Previously presented ) A method of transmitting a message from a sender to a recipient through a server displaced from the recipient, including the steps at the server of:

receiving the message at the server from the sender,

adding a pixel to the message at the server, the pixel capable of being altered to indicate that the message has been opened by a recipient,

transmitting the message and the pixel from the server to the recipient,

altering the pixel in the message when the message is opened at the recipient to indicate that the message was opened;

transmitting the message and the altered pixel from the recipient to the server when the message is opened at the recipient,

providing an encrypted hash of the message, including the indication of the opening of the message at the recipient, at the server, and

transmitting the message, including the indication of the opening of the message at the recipient, and the encrypted hash from the server to the sender.

2. (Original) A method as set forth in claim 1, including the steps at the server of:

receiving at the server the message, including the indication of the opening of the message at the recipient and the encrypted hash of the message, and

determining the authenticity of the message, including the opening of the message at the recipient, on the basis of the hash of the message, including the indication of the opening of the message at the recipient, and the hash decrypted from the encrypted hash.

3. (Previously presented) A method as set forth in claim 1, including the steps at the server of:

receiving from the sender the message, including the indication of the opening of the message at the recipient, and the encrypted hash of the message, including the indication of the opening of the message at the recipient,

hashing the message, including the indication of the opening of the message at the recipient, to provide a first digital fingerprint of the message including the indication of the opening of the message at the recipient,

decrypting the encrypted hash of the message, including the indication of the message at the recipient, to provide a second digital fingerprint of the message including the indication of the opening of the message at the recipient, and

comparing the first and second digital fingerprints to determine the authenticity of the message including the indication of the opening of the message at the recipient.

4. (Original) A method as set forth in claim 3, including the steps at the server of:  
indicating to the sender the results of the comparison, and

disposing of the message, and including the indication of the opening of the message at the recipient, and the encrypted hash of the message, including the indication of the opening of the message at the recipient, when the message and the encrypted hash are transmitted by the server to the sender.

5. (Previously presented) A method as set forth in claim 1 wherein  
the server receives the message from the sender through the internet,  
the server transmits the message to the recipient through the internet,  
the server receives the message, including the indication of the opening of the message at the recipient, through the internet, and  
the server transmits the message, including the indication of the opening of the message at the recipient, through the internet to the sender.

6. (Previously Presented) A method as set forth in claim 5 wherein  
the server disposes of the message, including the indication of the opening of the message at the recipient, and the encrypted hash of the message, including the indication of the opening of

the message, when the message and the encrypted hash are transmitted by the server to the sender through the internet.

7. (Previously presented) A method of transmitting a message from a sender to a recipient through a server displaced from the recipient, including the steps at the server of:

receiving the message at the server from the sender,

transmitting the message from the server to the recipient through a network including at least one interim network station unknown to the sender at the time the message is transmitted, the message including an alterable pixel for indicating the opening of the message at the recipient,

altering the pixel to provide an indication that the message was opened by the recipient when the recipient opens the message and transmitting the message and the indication that the message was opened by the recipient to the server,

receiving the message, including the indication of the opening of the message at the recipient, at the server,

receiving an attachment at the server including an indication of the interim network stations which receive the message during the transmission of the message from the server to the recipient and back to the server,

providing encrypted hashes of the message, including the indication of the opening of the message at the recipient, and the attachment, and

transmitting to the sender the message, including the indication of the opening of the message at the recipient, and the attachment, and the encrypted hashes of the message, including the opening of the message at the recipient, and the attachment.

8. (Original) A method as set forth in claim 7, including the steps at the server of:

receiving at the server the message, including the indication of the opening of the message at the recipient, the attachment and the encrypted hashes of the message, including the indication of the opening of the message at the recipient, and the attachment, and

determining the authenticity of the message, including the opening of the message at the recipient, on the basis of the hash of the messages, including the indication of the opening of the

message at the recipient, and the hash decrypted from the encrypted hash and the authenticity of the attachment on the basis of the hashed attachment and the hash decrypted from the encrypted hash of the attachment.

9. (Previously presented) A method as set forth in claim 7, including the steps at the server of:

reviewing from the sender the message, including the indication of the opening of the message at the recipient, the encrypted hash of the message, including the indication of the opening of the message at the recipient, the attachment and the encrypted hash of the attachment,

hashing the message, including the indication of the opening of the message at the recipient, and the attachment to provide first digital fingerprints of the message, including the indication of the opening of the message at the recipient and the attachments,

decrypting the encrypted hash of the message, including the indication of the opening of the message at the recipient, and the attachment to provide second digital fingerprints of the message, including the indication of the opening of the message at the recipient and the attachment, and

comparing the first and second digital fingerprints of the message, including the indication of the opening of the message at the recipient, to determine the authenticity of the message, including the indication of the opening of the message at the recipient and first and second fingerprints of the attachment to determine the authenticity of the attachment.

10. (Previously Presented) A method as set forth in claim 9, including the steps at the server of:

indicating to the sender the results of the comparison, and

disposing of the message, including the indication of the opening of the message at the recipient, and the encrypted hash of the message, including the indication of the opening of the message at the recipient, and the attachment and encrypted hash of the attachment when the message, the attachment and the encrypted hashes are transmitted by the server to the sender.

11. (Previously presented) A method as set forth in claim 10 wherein

the server receives the message from the sender through the internet and wherein

the server transmits the message to the recipient through the internet and wherein  
the server re-transmits the message, including the indication of the opening of the  
message at the recipient, to the recipient through the internet and wherein  
the server transmits the message through the internet to the sender.

12. (Original) A method as set forth in claim 11 wherein

the server indicates the results of the comparison to the sender through the internet and  
wherein

the server disposes of the message, the attachment and the encrypted hashes of the  
message and the attachment when the message and the encrypted hash are transmitted by the  
server to the sender through the internet.

13. (Previously presented) A method of transmitting a message from a sender to a  
recipient through a server displaced from the recipient, including the steps at the server of:

receiving the message at the server from the sender,

transmitting the message from the server to the recipient through a network having at  
least one interim station unknown to the sender, the message including a pixel added at the  
server capable of being altered to indicate that the message has been opened by a recipient,

altering the pixel when the message is opened by the recipient and transmitting the  
message and the altered pixel from the recipient to the server,

receiving the message at the server, including the altered pixel indicating that the  
message was opened at the recipient and an attachment and also including a list of the interim  
stations which receive the message during the transmission of the message from the server to the  
recipient and back to the server,

providing an encrypted hash of the combination of the message and the attachment,

transmitting to the sender from the server the message and the attachment and the  
encrypted hash of the combination of the message and the attachment.

14. (Original) A method as set forth in claim 13 including the steps at the server of:  
receiving the message, the attachment and the encrypted hash of the combination of the message and the attachment from the sender,

hashing the combination of the message and the attachment to provide a first digital fingerprint and decrypting the encrypted hash of the combination of the message and the attachment to form a second digital fingerprint, and

determining the authenticity of the message and the attachment on the basis of the first and second digital fingerprints.

15. (Original) A method as set forth in claim 13, including the steps at the server of:  
receiving from the sender the message, the attachment and the encrypted hash of the combination of the message and the attachment,

hashing the combination of the message and the attachment to form a first digital fingerprint and decrypting the encrypted hash of the combination of the message and the attachment to form a second digital fingerprint, and

comparing the first and second digital fingerprints to determine the authentications of the message and the attachment.

16. (Original) A method as set forth in claim 15, including the steps at the server of:  
indicating to the sender the results of the comparison, and  
disposing of the message and the attachment and the encrypted hash of the message and the attachment when the message, the attachment and the encrypted hash of the combination of the message and the attachment are transmitted by the server to the sender.

17. (Original) A method as set forth in claim 13 wherein  
the server receives the message from the sender through the internet and wherein  
the server transmits the message to the recipient through the internet and wherein  
the server receives the message including the indication of the opening of the message at the recipient, and the attachment from the recipient and wherein

the server transmits the message and the attachment and the hash of the combination of the message and the attachment.

18. (Previously presented) A method as set forth in claim 17 wherein

the server disposes of the message, the attachment and the encrypted hash of the combination of the message and the attachment when the message and the attachment and the encrypted hash are transmitted by the server to the sender through the internet.

19. (Withdrawn) A method of transmitting a message from a sender to a recipient through a server displaced from the recipient, the step at the server of:

receiving the message from the sender,

assigning the message a unique identification number,

providing a particular tag which includes a unique identification of the message and the recipient,

transferring a database,

transferring to the database the relationship between the sender and the unique identification of the sender and the relationship between the message and the unique identification of the message,

receiving the message from the recipient with an indication in the message that the message has been opened by the recipient,

extracting the identification of the sender,

extracting the unique identification of the message and the recipient from the data in accordance with the unique identifications of the message and the recipient, and

transmitting to the sender an indication that the message has been opened at the recipient.

20. (Withdrawn) A method as set forth in claim 19 wherein

there is at least one other addressee in addition to the recipient and wherein

the server assigns a unique identification to the one other addressee and records this unique identification in the database to identify the one other addressee.

21. (Withdrawn) A method as set forth in claim 19 wherein the particular format is an HTML format.
22. (Withdrawn) A method as set forth in claim 19 wherein the server passes the message to the recipient through the internet and wherein the server receives the message through the internet with the indication of the opening of the message.
23. (Withdrawn) A method as set forth in claim 21 wherein there is at least one other addressee in addition to the recipient and wherein the server assigns a unique identification to the one other addressee and records this unique identification in the database to identify the one other addressee the server passes the message to the recipient through the internet and wherein the server receives the message through the internet with the indication of the opening of the message.
